**FAST ETHERNET TRANSCEIVER** 

V1.14 DATE 2021/10/17

#### Revision History

| Revision | Release Date | Summary  |  |
|----------|--------------|--|--|
| 1.0      | 2019/07/11   | Add POS, WOL description                         |  |
|          |              | Update Register table                            |  |
| 1.01     | 2019/09/04   | Update Electrical Characteristics                |  |
| 1.02     | 2019/09/11   | Modify RBIAS resistor to 2.49k ohm               |  |
| 1.03     | 2019/10/16   | Modify errors                                    |  |
| 1.04     | 2019/11/05   | Update Register                                  |  |
| 1.05     | 2019/11/12   | Update Block diagram                             |  |
| 1.06     | 2020/01/13   | Add EPAD description                             |  |
| 1.07     | 2020/03/16   | Modify package information, ordering information |  |
|          |              | Add thermal resistance                           |  |
| 1.08     | 2020/03/23   | Add Copyright Statement and Disclaimer           |  |
|          |              | Add Reg ext 0x200a                               |  |
|          |              | Modify Rbias pin description                     |  |
| 1.09     | 2020/03/26   | Add Packaging Type                               |  |
|          |              | Release  |  |
| 1.10     | 2020/04/22   | Modify Thermal resistance description            |  |
|          |              | Pin 30,31,32 pin Description                     |  |
| 1.11     | 2020/04/24   | Update Register                                  |  |
|          |              | Modify RMII description                          |  |
| 1.12     | 2020/10/16   | Modify company name and logo                     |  |
| 1.13     | 2020/12/17   | Modify power sequence description.               |  |
| 1.14     | 2021/10/17   | Modify RMII timing                               |  |
| 1.17     | 2021/10/17   | Modify Kiviff tilling                            |  |

#### 1. GENERAL DESCRIPTION

The YT8512C YT8512H is a low power single-port 10/100 Mbps Ethernet PHY. It provides all physical layer functions needed to transmit and receive data over both standard twisted pair cables transceiver. Additionally, the YT8512C YT8512H provides flexibility to connect to a MAC through a standard MII and RMII interface.

The YT8512C YT8512H uses mixed-signal processing to perform equalization, data recovery, and error correction to achieve robust operation over CAT5 twisted-pair cable.

The YT8512C YT8512H offers integrated built-in self-test and loopback capabilities for ease of use.

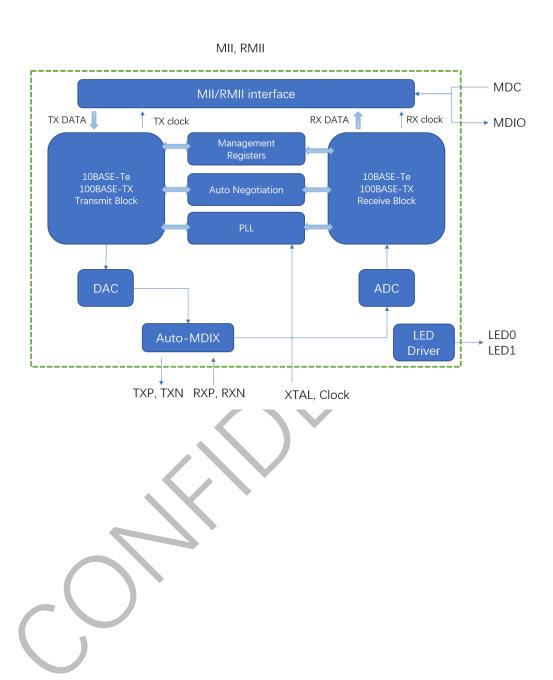

The YT8512C YT8512H offers innovative and robust approach for reducing power consumption through EEE, WoL and other programmable energy savings modes.

#### TARGET APPLICATION

- General Embedded Applications
- Video Surveillance
- Industrial Controls
- Factory Automation

#### **BLOCK DIAGRAM**

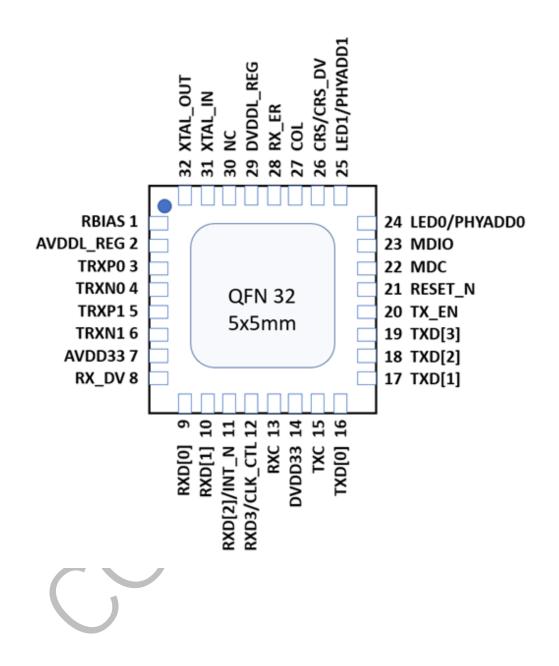

## 2. FEATURE

- EEE 802.3az, EEE
- 100Base-TX
- 10Base-Te
- MII mode
- RMII mode
- Full/Half duplex
- Auto-negotiation
- Power down mode
- Base Line Wander (BLW) compensation
- Auto MDIX
- Interrupt function
- WOL, Wake on Lan
- Automatic Polarity correction
- 2 sets LED indicator
- 25 MHz crystal or OSC
- Provide 50Mhz clock source for MAC
- Single Power supply, internal LDO
- Package QFN 32, 5x 5mm

#### 3. PIN ASSIGMENT

#### YT8512C YT8512H QFN32 5X5MM

#### PIN DESCRIPTIONS

- $\bullet$  I = Input
- $\bullet$  O = Output
- I/O = Bidirectional
- OD = Open-drain output
- PU = Internal pull-up
- PD = Internal pull-down
- HZ= High Impendence during power on reset
- PWR= Power related
- XT= Crystal related

| No. | Name       | Type   | Description   |
|-----|------------|--------|---|
| 1   | RBIAS      | I      | Bias Resistor.  |
| •   |            |        | An external 2.49 k $\Omega$ ±1% resistor must be connected  |
|     |            |        | between the RBIAS pin and GND                               |
| 2   | AVDDL_REG  | PWR/O  | Power Output.   |
| _   | 11,222_122 | 1 1110 | Be sure to connect a 1uF +0.1uF ceramic capacitor for       |
|     |            |        | decoupling purposes.  |
| 3   | TRXP0      | IO     | Transmit/Receive Pairs for channel 0. Differential data     |
|     |            |        | from copper media is transmitted and received on the        |
|     |            |        | single TRD± signal pair. There are 50Ω internal             |
| 4   | TRXN0      | IO     | terminations on each pin. Since this device incorporates    |
|     |            |        | voltage driven DAC, it does not require a center-tap        |
|     |            |        | power supply.   |
| 5   | TRXP1      | IO     | Transmit/Receive Pairs for channel 1. Differential data     |
|     |            |        | from copper media is transmitted and received on the        |
|     |            |        | single TRD± signal pair. There are 50Ω internal             |
|     |            |        | terminations on each pin. Since this device incorporates    |
| 6   | TRXN1      | IO     | voltage driven DAC, it does not require a center-tap        |
|     |            |        | power supply.   |
| 7   | AVDD33     | PWR    | 3.3V Analog Power Input.                                    |
|     |            |        | 3.3V power supply for analog circuit; should be well        |
|     |            |        | decoupled.  |
| 8   | RX_DV      | O/PD   | Receive Data Valid.   |
|     |            |        | This pin's signal is asserted high when received data is    |
|     |            |        | present on the RXD[3:0] lines. The signal is de-asserted    |
|     |            |        | at the end of the packet. The signal is valid on the rising |
|     |            |        | edge of the RXC.  |
|     |            |        | This pin should be pulled low when operating in MII         |
|     |            |        | mode.   |
|     |            |        | Power On Strapping for MII/RMII selection.                  |
|     | 1          |        | 0: MII mode   |
|     |            |        | 1: RMII mode  |
|     |            |        | An internal weakly pulled low resistor sets this to the     |
|     |            |        | default of MII mode. It is possible to use an external      |
|     |            |        | $4.7K\Omega$ pulled high resistor to enable RMII mode.      |
|     |            |        | After power on, the pin operates as the Receive Data        |
|     |            |        | Valid pin.  |
| 9   | RXD[0]     | O/PD   | Receive Data [0]  |
| 10  | RXD[1]     | O/PD   | Receive Data [1]  |
|     |            |        | An internal weakly pulled low resistor sets RXD[1] to the   |
|     |            |        | LED function (default). Use an external $4.7K\Omega$ pulled |
|     |            |        | high resistor to enable the WOL function.                   |

| 11 | DVD[21/INT N   | O/OD/ | Pagaiya Data [2]  |
|----|----------------|-------|---|
| 11 | RXD[2]/INT_N   | PD    | Receive Data [2] When in PMII made this pin is used for the interrupt |

#### POWER ON STRAPPING

| No. | Name                  | POS                                 | Internal Pull/Down  | Description   |
|-----|-----------------------|-------------------------------------|---------------------|---|
| 24  | LED0/ PHYAD[0]        | phy_address[0]                      | Pull Down           | The power-on strapping value of PAD RXD1, wol_led_sel, determines the PAD LED0 working as LED0 or PMEB.  Wol_led_sel=0, this PAD works as LED0, it could be external PU or PD,  Wol_led_sel=1, this PAD works as PMEB, it shall be external pull-up, then phy_address[0] always =1; |
| 25  | LED1/<br>PHYAD[1]     | phy_address[1]                      | Pull Down           | The PHY address is 00000~00011 config by phy_address[1:0]   |
| 10  | RXD[1]                | Wol_led_sel (Wake on LAN selection) | Pull Down           | The power-on strapping value of PAD RXD1, Wol_led_sel, determines the PAD LED0 working as LED0 or PMEB.  1, LED0 works as PMEB (WOL interrupt)  0, LED0 works as LED0.  |
| 8   | RXD[3]/CLK_CTL  RX_DV | Clock control  MII mode selection   | Pull Down Pull Down | The power-on strapping value of {RX_DV, RXD3} determines the xMII mode: {RX_DV, RXD3}=2'b00 means MII mode; {RX_DV, RXD3}=2'b01 means ReMII mode;   |

|  | {RX_DV, RXD3}=2'b10 means  |
|--|--|
|  | RMII2 mode; TXC 50Mhz  |
|  | reference clock is output  |
|  | {RX_DV, RXD3}=2'b11 means RMII1 mode; TXC 50Mhz reference clock is input |

#### MODE CONFIG

| Pin 8      | Pin 12    | Mode   |
|------------|-----------|--|
| RX_DV (PD) | RXD3 (PD) |  |
| 0          | 0         | MII  |
| 0          | 1         | ReMII,   |
|            |           | Reverse MII Mode                               |
| 1          | 0         | RMII2,   |
|            |           | TXC 50Mhz reference clock is output by default |
| 1          | 1         | RMII1,   |
|            |           | TXC 50Mhz reference clock is input             |

## PHY ADDRESS

| Pin 24             | Pin 25             | PHY address |
|--------------------|--------------------|-------------|
| LED0/PHYAD[0] (PD) | LED1/PHYAD[1] (PD) |             |
| 0                  | 0                  | 00000       |
| 0                  | 1                  | 00010       |
| 1                  | 0                  | 00001       |
| 1                  | 1                  | 00011       |

#### WAKE ON LAN SELECTION

| Pin 10    | Function | Mote                  |
|-----------|----------|-----------------------|
| RXD1 (PD) |          |                       |
| 0         | LED Mode | Pin 24 is LED0        |
| 1         | WOL Mode | Pin 24 is PMEB,       |
|           |          | Must external pull up |

## 3 FUNCTION DESCRIPTION

#### APPLICATION DIAGRAM

#### 100BASE-TX/10BASE-TE APPLICATION

#### MII INTERFACE

The Media Independent Interface (MII) is the digital data interface between the MAC and the physical layer that can be enabled when the device is functioning in 10BASE-Te, 100BASE-TX,. The original MII transmit signals include TX\_EN, TXC, TXD[3:0], and TX\_ER. The receive signals include RX\_DV, RXC, RXD[3:0], and RX\_ER. The media status signals include CRS and COL. Due to pincount limitations, the YT8512 supports a subset of MII signals. This subset includes all MII signals except TX\_ER.

#### RMII INTERFACE

Reduced media-independent interface (RMII) is a standard which was developed to reduce the number of signals required to connect a PHY to a MAC. If this interface is active, the number of data signal pins required to and from the MAC is reduced to half by doubling clock frequency.

#### MANAGEMENT INTERFACE

The Status and Control registers of the device are accessible through the MDIO and MDC serial interface. The functional and electrical properties of this management interface comply with IEEE 802.3, Section 22 and also support MDC clock rates up to 12.5 MHz

#### DAC

The digital-to-analog converter (DAC) transmits MLT3, and Manchester coded symbols. The transmit DAC performs signal wave shaping that reduces electromagnetic interference (EMI). The transmit DAC uses voltage driven output with internal terminations and hence does not require external components or magnetic supply for operation.

#### ADC

Receive channel has its own analog-to-digital converter (ADC) that samples the incoming data on the receive channel and feeds the output to the digital data path.

#### ADAPTIVE EQUALIZER

The digital adaptive equalizer removes inter-symbol interference (ISI) created by the channel. The equalizer accepts sampled data from the analog-to-digital converter (ADC) on channel and produces equalized data. The coefficients of the equalizer are adaptive to accommodate varying conditions of cable quality and cable length.

#### **AUTO- NEGOTIATION**

The YT8512 negotiates its operation mode using the auto negotiation mechanism according to IEEE 802.3 clause 28 over the copper media. Auto negotiation supports choosing the mode of operation automatically by comparing its own abilities and received abilities from link partner. The advertised abilities include:

- a) Speed: 10/100Mbps
- b) Duplex mode: full duplex and/or half duplex
- c) Pause

Auto negotiation is initialized when the following scenarios happen:

- a) Power-up/Hardware/Software reset
- b) Auto negotiation restart
- c) Transition from power-down to power up
- d) Link down

Auto negotiation is enabled for YT8512 by default, and can be disable by software control.

#### POLARITY DETECTION AND AUTO CORRECTION

YT8512 can detect and correct two types of cable errors: swapping of pairs within the UTP cable and swapping of wires within a pair.

For 10BASE-Te/100BASE-TX, YT8512 can handle both cable errors at the same time.

#### EEE

EEE is IEEE 802.3az, an extension of the IEEE 802.3 standard. EEE defines support for the PHY to operate in Low Power Idle (LPI) mode which, when enabled, supports QUIET times during low link utilization allowing both link partners to disable portions of each PHY's circuitry and save power.

#### 4 OPERATIONAL DESCRIPTION

#### RESET

YT8512 have a hardware reset pin(RESET\_N) which is low active. RESET\_N should be active for at least 10ms to make sure all internal logic is reset to a known state. Hardware reset should be applied after power up.

RESET\_N is also used as enable for power on strapping. After RESET\_N is released, YT8512 latches input value on POS related pins are used as configuration information which provides flexibility in application without mdio access.

YT8512 also provides a software reset control registers which are used to reset all internal logic except some mdio configuration registers. For detailed information about what register will be reset by software reset, please refer to register table.

#### PHY ADDRESS

For YT8512, phy\_address[1:0] is used to generate phy address.

Please refer to the POS setting as below. PHY address

| Pin 24              | Pin 25             | PHY address |
|---------------------|--------------------|-------------|
| LED0/ PHYAD[0] (PD) | LED1/PHYAD[1] (PD) |             |
| 0                   | 0                  | 00000       |
| 0                   | 1                  | 00010       |
| 1                   | 0                  | 00001       |
| 1                   | 1                  | 00011       |

#### XMII INTERFACE

YT8512 support 4 kinds of MII related interfaces: MII, RMII1, RMII2 and REMII.

MII

The Media Independent Interface (MII) is the digital data interface between the MAC and the physical layer that can be enabled when the device is functioning in 10BASE-Te, 100BASE-TX, The original MII transmit signals include TX\_EN, TXC, TXD[3:0], and TX\_ER. The receive signals include RX\_DV, RXC, RXD[3:0], and RX\_ER. The media status signals include CRS and COL. Due to pin-count limitations, the YT8512 supports a subset of MII signals. This subset includes all MII signals except TX\_ER. For 100M application, TXC and RXC are 25MHz; for 10M application, TXC and RXC are 2.5MHz. TXC and RXC are output in this case.

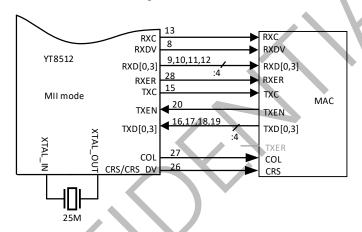

Figure . connection diagram of MII

#### **RMII**

Reduced media-independent interface (RMII) is a standard which was developed to reduce the number of signals required to connect a PHY to a MAC. If this interface is active, the number of data signal pins required to and from the MAC is reduced to half by doubling clock speed compared to MII. It has 7 signals: REF\_CLK, TX\_EN, TXD[1:0], RX\_DV and RXD[1:0]. In YT8512, we use TXC as REF\_CLK. For 100M application, REF\_CLK is 50MHz; for 10M application, REF\_CLK is still 50MHz, data will be duplicated for 10 times in 20ns cycles. YT8512 supports two types of connection method;

- 1. RMII1 mode: This is fully conforming to RMII standard.
- 2. RMII2 mode: TXC will be 50MHz output to MAC.

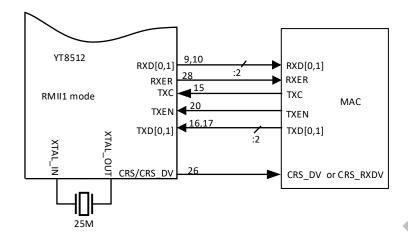

Figure .connection diagram of RMII1(with 25MHz and 50MHz clock)

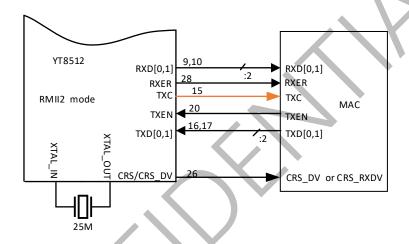

Figure .connection diagram of RMII2

#### REMII INTERFACE

Reverse media independent interface is the opposite of MII interface. The only difference is the direction of tx clock and rx clock. For MII, tx clock and rx clock are output; for REMII, tx clock and rx clock are input. REMII interface are used for back to back connection of two phys.

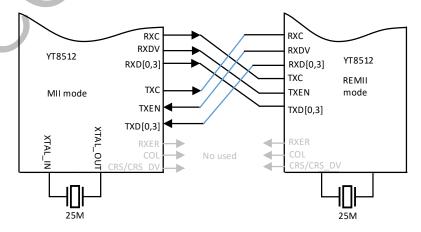

Figure .connection diagram of REMII

#### LOOPBACK MODE

There are three loopback modes in YT8512.

#### INTERNAL LOOPBACK:

In Internal loopback mode, YT8512 feed transmit data to receive path in chip.

Configure bit 14 of mii register(address 0h0) to enable internal loopback mode. For 10Base-Te and 100Base-Tx, YT8512 feeds digital DAC data to ADC directly.

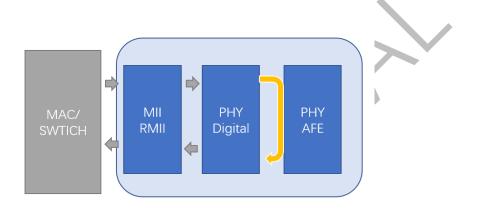

Figure . Internal loopback

#### EXTERNAL LOOPBACK

In external loopback mode, YT8512 feed transmit data to receive path out of chip. For 10Base-Te and 100Base-Tx, just connect TRX\_P0/N0 to TRX\_P1/N1.

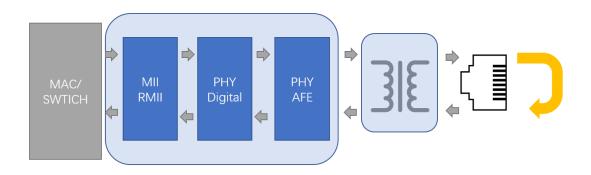

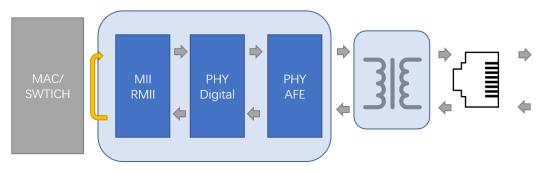

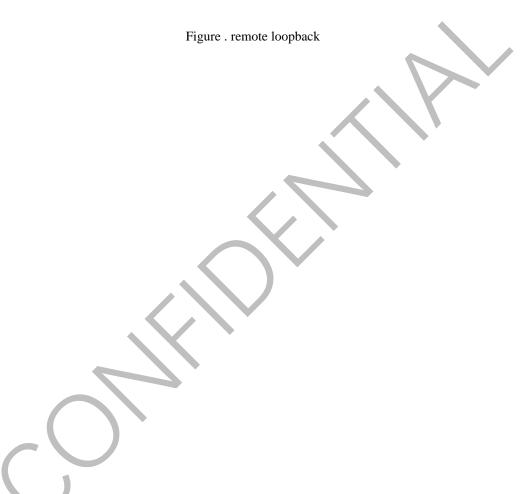

Figure . external loopback

#### REMOTE LOOPBACK

In remote loopback mode, YT8512 feed MII receive data to transmit path in chip. Configure bit 11 of extended register(address 0h4000) and for TRX interface, just connect to link partner normally.

#### WOL WAKE ON LAN

WOL

Wake-on-LAN (WOL) is a mechanism to manage and regulate the total network power consumption.

#### **WOL MECHANISM**

YT8512 supports automatic detection of a specific frame and notification via dedicated hardware interrupt pin or general PHY interrupt pin. The specific frame contains a specific data sequence located anywhere inside the packet. The data sequence consists of 6 bytes of consecutive 1 (0xFFFFFFFFFFF), followed by 16 repetitions of the MAC address of the computer to be waked up. The 48-bit MAC address is written in EXT 0x4004, 0x4005, 0x4006 registers.

For example, to write a specific MAC address (0xAAAABBBBCCCC) to PHY, write EXT 0x4004 = 0xAAAA, 0x4005 = 0xBBBB, and 0x4006 = 0xCCCC. The PHY internal MAC address can be set to any value.

NOTE: The MAC address is not a real MAC address and is only a symbol to indicate the content of the frame.

The WOL mechanism is enabled via EXT 0x4000 bit2. POS RXD[1] can't control enable or disable the WOL mechanism but only control pad LED0 working as WOL interrupt.

#### WOL INTERRUPT

YT8512 support dedicated WOL interrupt pin. When the pad RXD[1] is externally PULL UP, pad LED0 will work as WOL interrupt.

If EXT 0x4003 bit7 is 0, the dedicated WOL interrupt is programmed to a level, otherwise, it's programmed to a pulse; either is active low. When it's programmed to a pulse, the pulse width can be programmed via EXT 0x4003 bit9:8.

WOL interrupt is also wire-and to general PHY interrupt RXD[2]\_INTN when the bit6 INT\_WOL in Interrupt enable register (MII Register 0x12) is set to 1. If the general PHY interrupt is triggered by WOL, it can be cleared by reading MII register 0x13 bit6.

#### NOTE:

When general PHY interrupt is used to monitor WOL interrupt, EXT 0x4003 bit7 should be 1, otherwise, the general PHY interrupt can't be read cleared.

Because PHY requires to receive packets from the line side, PHY cannot be powered down. If the link partner supports Energy Efficient Ethernet function, both ends can use EEE mode to save more power.

MII register 0x0 bit10 ISOLATE: When this bit is set to 1, the xMII output pins are HighZ. The xMII inputs are ignored.

## 5 REGISTER OVERVIEW

#### MII MANAGEMENT INTERFACE CLAUSE 22 REGISTER PROGRAMMING

The YT8512 transceiver is designed to be fully compliant with the MII clause of the IEEE 802.3u Ethernet specification.

The MII management interface registers are written and read serially, using the MDIO and MDC pins.

A clock of up to 12.5 MHz must drive the MDC pin of the YT8512. Data transferred to and from the MDIO pin is synchronized with the MDC clock. The following sections describe what each MII read or write instruction contains.

| Notation | Description          |
|----------|----------------------|
| RW       | Read and write       |
| SC       | Self-clear           |
| RO       | Read only            |
| LH       | Latch high           |
| LL       | Latch Low            |
| RC       | Read clear           |
| SWC      | Software reset clear |

#### MDC/MDIO TIMING

| Symbol                | Description                   | Min | Тур | Max | Unit |
|-----------------------|-------------------------------|-----|-----|-----|------|
| T <sub>DLY_MDIO</sub> | MDC to MDIO Output Delay Time |     |     | 20  | ns   |
| T <sub>SU_MDIO</sub>  | MDIO Input to MDC Setup Time  | 10  |     |     | ns   |
| T <sub>HD_MDIO</sub>  | MDIO Input to MDC Hold Time   | 10  |     |     | ns   |
| T <sub>P_MDC</sub>    | MDC Period                    | 80  |     |     | ns   |
| T <sub>H_MDC</sub>    | MDC High                      | 30  |     |     | ns   |
| T <sub>L_MDC</sub>    | MDC Low                       | 30  |     |     | ns   |
| Maximum Frequ         | ency = 12.5M Hz               |     |     |     |      |

#### POWER ON SEQUENCE/CLOCK/RESET

When using crystal, the clock generated internally, or 1.2V power from internal LDO, the sequence between clock and 3.3V, or 1.2V and 3.3V is determined by YT8512 inside and can be ignored.

When using external clock CLK\_25MHz or 1.2V power from external power supply, the sequence between CLK\_25MHz and 3.3V, or 1.2V and 3.3V should meet the requirements of the figure above.

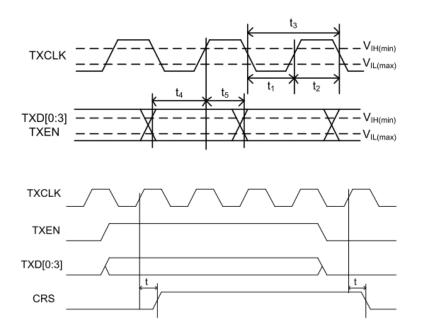

No matter the clock and 1.2V from internal or external, for a reliable power on reset, suggest to keep asserting the reset low long enough (10ms) to ensure the clock is stable and clock-to-reset 10ms requirement is satisfied.

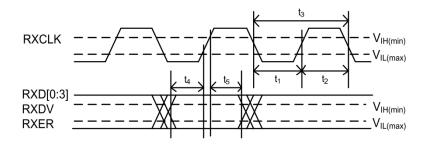

### MII TRANSMISSION CYCLE TIMING

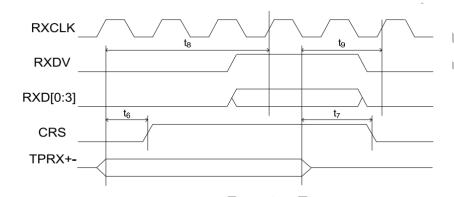

| Symbol | Description                  |         | Minimum | Typical | Maximum | Unit |
|--------|------------------------------|---------|---------|---------|---------|------|
| t1     | TXCLK High Pulse Width       | 100Mbps | 14      | 20      | 26      | ns   |
|        |                              | 10Mbps  | 140     | 200     | 260     | ns   |

|         | 100M   | 2.1           | 56.8   | 1.1    | 60.9      |

#### Unit is mA

Note: The power consumption is measured under room temperature with typical process DUT.

#### MAXIMUM POWER CONSUMPTION MII MODE

| Condition |      | 3.3V(Pull up) | AVDD33 | DVDD33 | 3.3V      |
|-----------|------|---------------|--------|--------|-----------|
|           |      |               |        |        | total(mA) |
| Traffic   | 100M | 2.3           | 68.1   | 8      | 78.4      |

Note: The Maximum power consumption is measured under high temperature ( $T_A=85^{\circ}C$ ) with FF corner process (fast nmos and fast pmos)DUT.

# 8 PACKAGE INFORMATION

### ROHS-COMPLIANT PACKAGING

Motor-comm offers a RoHS package that is compliant with RoHS

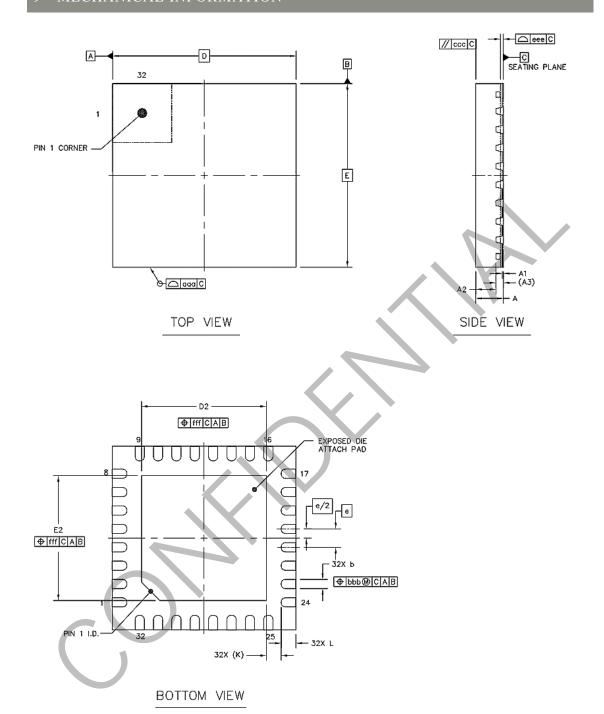

| Part Number | Status | Package      | Op temp (°C) | Note |
|-------------|--------|--------------|--------------|------|
| YT8512C     | Active | QFN 32 5x5mm | 0 to 70      |      |
| YT8512H     | Active | QFN 32 5x5mm | -40 to 85    |      |

#### THERMAL RESISTANCE

| Symbol                 | Parameter   | Conditon  | Тур  | Units |
|------------------------|---|---|------|-------|
| $\theta_{\mathrm{JA}}$ | Thermal resistance - junction to ambient $\theta_{JA} = \; (T_J - T_A)/\; P$ $P = Total \; power \; dissipation$  | JEDEC  3 in. x 4.5 in. 4-layer PCB with no air flow T <sub>A</sub> =25°C  JEDEC  3 in. x 4.5 in. 4-layer PCB with no air flow T <sub>A</sub> =125°C | 37.8 | °C/W  |
| θјс                    | Thermal resistance - junction to case $\theta_{JC} = (T_J - T_C) /  Ptop$ $Ptop =  Power  dissipation  from  the  top  of  the  package$                      | JEDEC with no air flow  | 35   | °C/W  |
| θ <sub>JB</sub>        | Thermal resistance - junction to board $\theta_{JB} = (T_J - T_B)/  Pbottom$ $Pbottom = Power dissipation from the bottom of the package to the PCB surface.$ | JEDEC with no air flow  | 16.3 | °C/W  |
